ARTICLES

HOW MAN CAME TO NORTH AMERICA by Ralph Solecki

It has long been assumed that he traveled from Asia, but exactly what route did he take and when? An answer to the question has been suggested by recent archaeological finds along the north coast of Alaska. 11

THE HUMAN BODY IN SPACE by Heinz Haber

The possibility of traveling to other planets has been considered principally from the standpoint of physics and engineering. Now the biological effects of the interplanetary environment are under investigation. 16

FLAGELLA by W. T. Astbury

The whiplike appendages of bacteria are among the smallest living structures. They behave like small muscles; thus they are studied to reveal the basic properties of muscle and other contractile proteins. 20

THE ECONOMICS OF ATOMIC POWER by Sam H. Schurr

When atomic power plants are built, how will they compete with other sources of energy? An account of the first thorough inquiry into the usefulness of nuclear fuels in various industries and various regions. 32

pH by Duncan A. MacInnes

The familiar symbol of physical chemistry represents values on a scale of acidity and alkalinity. Although it has become indispensable in the laboratory and in industry, its fundamental meaning is little understood. 40

RED DOG, BLACKJACK, POKER by R. Bellman and D. Blackwell

Although mathematicians do not invariably win at it, poker is one of the principal studies of the mathematical theory of games. The somewhat simpler games Red Dog and Blackjack illustrate elements of the theory. 44

AN EXPLANATION OF TWINS by Gunnar Dahlberg

Considering that most mammals bear offspring in litters rather than one at a time, single births are just as remarkable as multiple births. The latter phenomena provide a clue to the processes responsible for both. 48

THE EELGRASS CATASTROPHE by Lorus J. and Margery J. Milne

Twenty years ago this weed of the sea all but disappeared from the Atlantic coast. Now it is coming back. The effect of its absence upon aquatic animal life demonstrates the interdependence of living things. 52
